

## Project Profile

### Industrial Decommissioning Verification Sampling Program Manufacturing Plant, Central Canada

This decommissioning verification program involved carrying out a complete review of past environmental reports and process practices at the site to ensure that all potential environmental liabilities were identified. A sampling program was developed to verify that the environmental conditions at the site met the criteria of the 1996 *Guidelines for Use at Contaminated Sites in Ontario*.

The sampling program involved strategically located soil sampling boreholes and groundwater monitoring wells throughout the property and including the building interior.

Contaminated soils were removed where required and verification sampling was continued to verify the absence of contamination

A *Summary of Environmental Site Condition* report was completed describing the final conditions of the site.
