

## Project Profile

### Warehouse and Laboratory Conversion Central Canada

The work was executed in conjunction with a selected contractor and followed a very tight schedule. The 13,400 sq. ft space is utilized for the restoration, preservation and storage of period artifacts. Other rooms included the artifact receiving area, office areas, a 2,700 sq. ft. library, the main storage area, and the mechanical / electrical room.

The warehouse portion required special climate control devices and equipment to avoid any deterioration or humidity damage to the artifacts. Energy efficiency was equally an important design consideration with ground source heat pumps as the main heat source.

**Services:** Prepare all the necessary construction drawings for the mechanical and electrical disciplines including the layout for all interior partitioning and detailing.
