

## Project Profile

**HVAC System Modifications**  
**18,000 sq. ft. Office Building**  
Central Canada

An investigation and study was completed to ascertain the building's HVAC system design flaws. The Client wanted to eliminate cold and hot spots within the building including improving the quality of air within all areas of the office complex. The work involved the replacement of two roof top units, major modifications to the duct distribution system, a systematic air balancing program, and controls upgraded for energy efficiency.

**Services:** Design and construction documents including specifications for tender and a tailored supervision program to execute construction on week-ends only.
