

Project Profile

Industrial Boiler Installation

Maitland, Ontario

SUMMARY:

A portion of the client's site was being decommissioned as part of some industrial downsizing. The existing site steam boilers were placed in multiple locations and were old and inefficient. The client was looking for an efficient boiler installed in a central plant location to service the existing needs of the plant.

The steam requirements of the plant were analyzed and a new boiler was sized. A central location was chosen for the boiler such that existing services were close and cost effective to tie into. These services included steam headers, natural gas lines, boiler feed water lines and boiler breaching.

HSP's involvement was to provide engineering services to size, design and provide site services during the installation of the new boiler.
